PREFACE

The Missouri Sentencing Advisory Commission is pleased to provide an annual report on sentencing and sentencing disparity in Missouri. The report is in fulfillment of the Commission's statutory responsibility to study sentencing practices and to report on the extent of disparity in sentencing disposition or length of sentences around the state and by race or ethnicity.

The report provides statistics on sentencing, the application of the death penalty and recidivism rates related to alternative sentences and prior criminal history.

The report has been produced with the assistance of professional staff in the Department of Corrections and in the Office of the State Courts Administrator.

Suggestions for topics to be included in future reports are welcome.

REPORT SUMMARY

Factors Determining Missouri's Incarceration Rate

At first glance, the best predictor of prison population would appear to be the number of offenders being sentenced and sent to prison at their first sentencing. However, the percentage growth in the prison population has been greater than the percentage growth of offenders being sentenced to prison at their first sentencing. The best predictor of changes in the prison population is the number of offenders being sentenced for a felony offense, regardless of disposition. This is due to the revocation effect. If the total number of offenders sentenced to probation at first sentencing increases then the number of probationers who are later revoked increases. If the number of offenders sentenced to 120-day and long-term treatment programs (Chapters 559 and 217, respectively) increases, then the number of probationers who are later revoked will also increase.

In fact, the revocation rate of offenders released from a Chapter 559 program is higher than that of offenders who are sentenced to straight probation. This makes sense because straight probation is, arguably, a lesser punishment than a Chapter 559 program and offenders sentenced to a Chapter 559 program generally have an increased criminal history. Prior criminal history not only influences sentencing but is also a risk measure. Simply stated, Chapter 559 participants represent a riskier group than those defendants sentenced to straight probation.

Of course, there are other factors that impact the prison population such as parole board release practices, minimum prison terms, no parole sentences, longer sentences for sex offenders, and the ever-growing list of dangerous felons (those required to serve 85% before parole consideration).

1. Felony Sentencing in Missouri

In fiscal 2015 (July 1, 2014 to June 30, 2015), the number of felony sentences decreased by 5.9%, from 28,835 in fiscal 2014 to 27,138. These sentences are first, final dispositions including suspended imposition of sentence (SIS), suspended execution of sentence (SES), Chapter 559 programs, Chapter 217 programs or unmitigated sentences to prison. Probation was granted in 64.5% of the sentences. The decrease in fiscal 2015 is opposite than in previous years, but it is in line with the slowing in new sentencing that has been occurring over the last 15 years. In the 1990s, the average annual increase in sentencing was 6.3% and in the first decade of the 21st century the average annual increase was 2.1%. This slowing in sentencing in the last decade is the major reason why the growth in the prison population has slowed. Nevertheless, in the last ten years the prison population has increased by the near equivalent of a new prison, 2,122 inmates (see page 2).

2. Circuit and County Rankings

Counties and circuit courts are ranked on nine sentencing and recidivism measures, and there are great variations in how counties sentence. One of the most striking disparities is in the percentage of defendants, who, at first, final disposition are sentenced to

unmitigated prison commitments - no SIS, no SES, no Chapter 559, no Chapter 217, etc. In fiscal 2015, while the state average for unmitigated prison commitments was 23.6%, one circuit sentenced over 50% of their defendants to prison, while eleven circuits sentenced less than 20% of their defendants to prison. Even when comparing metropolitan areas, significant differences exist: St. Louis City sentenced 27.1% of their defendants to prison compared to 18.6% by St. Louis County and 20.6% by Jackson County. The counties that use the Chapter 559 programs the most are generally the counties with a low percentage of unmitigated prison commitments. What is surprising is that the counties that have the most violent and serious crime, St. Louis and Jackson County, are not the counties that have the highest rate of prison sentences (see page 7). There has been a continuing national discussion on the appropriateness of incarceration for nonviolent offenders. On three measures Missouri is shown to have nearly 50% of its prison population serving nonviolent offenses but relatively few nonviolent offenders who are serving their first incarceration (6.1%) or their first felony (3.0%).

3. Incarceration and Felony Sentencing Rates

The incarceration rate for fiscal 2015 for a given county is the number of offenders in prison from that county on June 30, 2015 divided by the population of the sentencing county on June 30, 2015. The incarceration rate allows comparisons in sentencing between counties with small populations and counties with large populations (see chart Incarceration Rates, page 25).

Ranking 1st is St. Louis City with a population in excess of 300,000. On June 30, 2015, it had the highest incarceration rate in the state. Ranking 2nd and 3rd were Livingston and Dunklin Counties, respectively, with a population 1/7th the size of St Louis City. It would appear that St. Louis City's rate is primarily due to the large number of serious crimes it experiences - resulting in more and longer prison sentences; Livingston and Dunklin incarceration rates are likely due to the sheer amount of crime per population that they experience. Interestingly, in terms of the amount of crime (violent and nonviolent), St. Louis City is only ranked 39th in the State (see chart Felony Sentencing Rates, page 27).

4. Geographic Sentencing Disparity

Geographic sentencing disparity is the difference in sentencing around the state for specific offenses. The data show that rural counties issue more severe sentences for offenders with convictions for drugs, DWI and other nonviolent offenses than the metropolitan circuits. For example, rural counties sentenced 20% of drug offenders to prison while the metropolitan counties sentenced only 11% of offenders to prison. The sentencing of serious violent and sex offenses is closer, but rural counties still sentence more severely. For class A felony violent offenses (murder, robbery, assault and kidnapping), 83% of offenders were sentenced to prison by the metropolitan counties and the average sentence is 16.3 years, while 81.7% of offenders were sentenced to prison in rural counties with an average sentence of 20 years (see chart New Sentencing, Violent Offenses, page 30).

5. Sentencing Disparity by Race

Endeavoring to fairly analyze whether race forms the basis of a sentencing disparity requires an examination of the severity of the offense, prior criminal history and time served. Notwithstanding the need for this analytical approach, the frank numbers are that the Missouri incarceration rate for black offenders (based upon 100,000 population increments) is 4 times that of white offenders. Nationally, the rate is 5.3 times that of white offenders.

Fiscal 2015 sentencing data shows that for the four racial or ethnic groups: black, Hispanic, white and other (Native American, Asian and Pacific Islander), black offenders receive the highest average prison sentences (black, 7.7 years; Hispanic, 6.1 years; white, 5.8 years and other, 7.2 years). Further, when compared to white offenders, black offenders have a higher rate of unmitigated prison sentences (black, 26.8%; Hispanic, 26.8%; white, 22.9% and other, 24.1%; see chart New Sentencing, All Offenses, page 32).

An analysis by offense group (violent, nonviolent, DWI, drugs and sex/child abuse) indicates that white offenders show a greater rate of prison sentences than black offenders, but similar average sentences for nonviolent offenses (page 33). For the remaining offenses:

White offenders show a slightly greater average sentence but similar rate of incarceration for DWI (page 33);

Black offenders are more likely to be sentenced to prison but with similar or shorter average sentences than white offenders for class A and B drug offenses and class C violent felonies (see charts, pages 34-35);

Blacks offenders show a greater rate of incarceration for class A violent offenses but much shorter average sentence than white offenders (page 35);

Black offenders show a greater average sentence for class A sex offenses, but lower average sentence for class B sex offenses than white offenders (page 36).

Prior criminal history could be a reason for sentencing disparities among races because prior criminal history results in more severe sentencing. In recent years, there has been little difference between the levels of prior criminal history of white and black males. What is surprising is that white females have a higher level of prior criminal history (49.5%) than black females (42.7%) (page 38).

Another source of the disparity may lie with the release practices of the Missouri Board of Probation and Parole. For offenders sentenced to a prison sentence, the Board of Probation and Parole has the discretionary responsibility to determine the release dates, subject to statutory restrictions on minimum prison time (Section 558.019, RSMo) and the statute that defines conditional release (Section 558.011, RSMo).

In fiscal 2015, the DOC released 7,254 offenders to their first release in their commitment. The average time served was 34 months which was 47.3% of the aggregate sentence. Black offenders served significantly more time than whites (45.7 months compared to 29.6 months). This is partly due to black offenders being sentenced to longer sentences (83 months compared to 67 months for white offenders, page 40). As a percent of

sentence, black offenders also served longer than white offenders (55% compared to 44% for white offenders). However, the difference between the actual time served and the Parole Board guideline time was similar for all races. The guideline time served is based upon a race neutral risk assessment, using risk factors that have been related to recidivism (see chart Sentence Served, page 40).

In order to more analytically evaluate the differences in sentencing between the races, a statistical model was developed that included the offense, the felony class, prior criminal history, race, gender, age and the circuit court of sentencing (Section 5). The analysis ranked the variables in the amount that they explained the sentence. The top three variables that explained most of the variation in sentencing were: the offense, the felony class and the prior criminal history. When the geographic diversity was represented by the three levels of metropolitan, first class and rural counties, race was included in the model. However, when the circuit court was included in the model, race became non-significant and was not selected.

The conclusion of the analysis is that race does not appear to significantly influence either sentencing or prison time served. This conclusion, of course, begs the questions: Are blacks a targeted population with more arrests, convictions, and, in turn, criminal histories? Are blacks charged with the same evenhandedness as other populations, or are they consistently charged with a more serious available charge? The analysis also indicated that great variations remain in how courts sentence even after accounting for the major sentencing variables.

6. Disparity in the Application of the Death Penalty

The number of offenders being sentenced to the death penalty has been declining for over a decade, as have the number of offenders being sentenced to Murder 1st degree and Murder 2nd degree. Although there is a great disparity in the number of black offenders being convicted of murder compared to all other races, there is a lesser percent being sentenced to capital punishment, either statewide or by circuit (see pages 53-54).

7. Recidivism and Sentencing Disposition

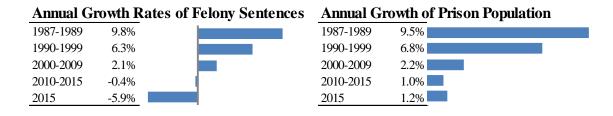

According to the data collected by the DOC, defendants with a Level I criminal history (no prior felonies and no more than 3 misdemeanors) who are placed on probation are less likely to violate probation and be sent to prison within two years of being placed on probation than are Level I defendants who are sentenced to an unmitigated prison sentence at their first final disposition and are released from prison (see chart Average Recidivism, page 56).

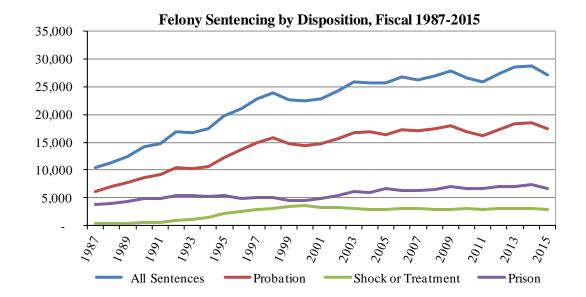

1. FELONY SENTENCING IN MISSOURI, FISCAL 1987-2015

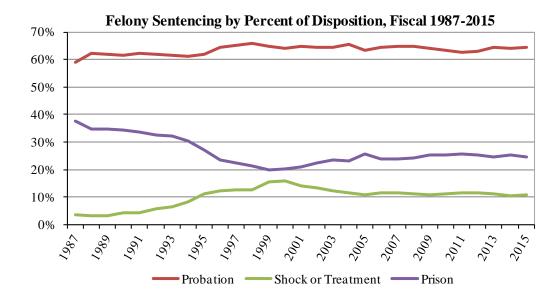

Felony Sentencing and Population

From June 30, 1987 to June 30, 2015, the prison population increased from 10,719 to 32,284, an increase of 200%. The main reason for that increase has been the increase in felony sentences. , Felony sentences have increased by 162% since fiscal 1987. What is most surprising, given the increase in the prison population, is that the percent of felony convictions that are sentenced to probation each year has changed very little. In FY1987, 59.0% of offenders received probation and in FY2015, 64.5% of offenders received probation. What changed in the period was the growth of 120-day (shock probation, Chapter 559.115, RSMo) and long-term drug sentences (Chapter 217.262, RSMo) in the 1990s. The increase in 120-day and long-term treatment programs has been an alternative to prison sentences. Since fiscal 2000, the percent of prison sentences has been slowly increasing but in line with the slower increase in new sentences.

In the last five years there has been an average decrease in felony sentences of less than 1% per year, but there is considerable variation from one year to the next. In fiscal 2012 and 2013, the increase in sentencing was over 4% each year while it declined by nearly 5% in fiscal 2010 and almost 6% in fiscal 2015. Despite the slowing in the prison population, the increase in the last decade has been 2,122, which is the equivalent of a new prison.

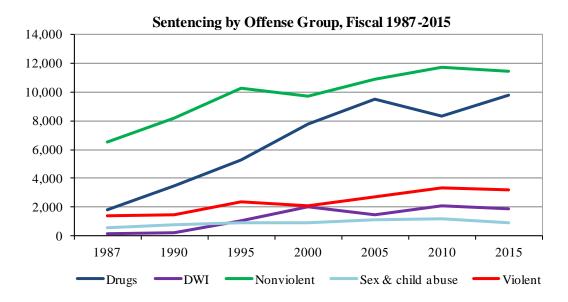

Felony Sentencing and Prison Population, Fiscal 1987-2015

			Disposition				Percent		Prison Population		
Fiscal	All		Shock or		Annual		Shock or			Annual

2008	26,902	17,396	2,988	6,518	2.2%	64.7%	11.1%	24.2%	30,033	0.3%	
2009	27,914	17,896	2,987	7,031	3.8%	64.1%	10.7%	25.2%	30,476	1.5%	
2010	26,594	16,863	3,005	6,726	-4.7%	63.4%	11.3%	25.3%	30,418	-0.2%	
2011	25,912	16,252	2,979	6,681	-2.6%	62.7%	11.5%	25.8%	30,771	1.2%	
2012	27,353	17,254	3,159	6,940	5.6%	63.1%	11.5%	25.4%	31,057	0.9%	
2013	28,499	18,367	3,154	6,978	4.2%	64.4%	11.1%	24.5%	31,435	1.2%	
2014	28,835	18,483	3,027	7,325	1.2%	64.1%	10.5%	25.4%	31,905	1.5%	
2015	27,138	17,511	2,938	6,689	-5.9%	64.5%	10.8%	24.6%	32,284	1.2%	

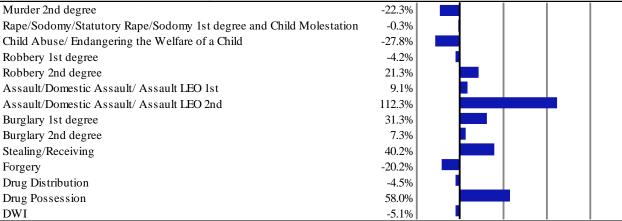

The increase in sentencing in the 1990s was lead by drug offenses, which averaged an increase of approximately 10% per through the 1990s. There was a decline from fiscal 2005 to 2010, but since 2010 the number of drug sentences has again been increasing. This increase has averaged nearly 3% per year in the last five years (particularly from drug possession). The greatest number of sentences is in nonviolent offenses (stealing, burglary, receiving), but this group has remained steady for the past five years with no average change per year. Violent offenses had been increasing from fiscal 2000 with the creation of new offenses for domestic violence and assault of a law enforcement officer, but the number of violent offenses has declined in the last five years by 1% a year.

Changes in Sentencing for the Top 15 Offenses, Fiscal 2000-2015

Average Prison Sentences and Disposition

Average sentences for most offenses have changed very little since fiscal 1987 but there have been new offenses, particularly for sex crimes and domestic assault. Many sex offenses have had the severity of sentencing increased, both in average prison sentence and the percent who are sentenced to prison. Most serious violent offenses (Murder 2nd, Robbery 1st and Assault 1st) have shown no change or a small decline in the average sentence. However, Rape/Sodomy 1st and Statutory Rape/Sodomy 1st have shown some increase in average sentence length. For a number of nonviolent and drug offenses there was a small increase in average sentence length, but most nonviolent and drug offenders (about 70%) are sentenced to probation. Over 60% of offenders convicted of class B felony drug distribution are sentenced to probation.

Average Sentence (years) of Fifteen Top Offenses by Fiscal Year

	1987	1990	1995	2000	2005	2010	2015
Murder 2nd degree	23.6	22.9	22.8	22.8	22.0	22.5	20.8

Source: DOC. Offenders received by the DOC for a new sentence (probation, shock probation, drug treatment or prison commitment). Multiple sentences handed down on the same day and in the same court are counted as one sentence and the offense is the most serious in offense severity and length of sentence.

2. CIRCUIT AND COUNTY RANKINGS

When circuits are compared by sentence type and by average prison sentence at first, final disposition there are wide variations in sentencing practice. Using the sentence data for offenders received by the Department of Corrections for fiscal 2015, the 45 Missouri circuit courts have been ranked using six measures:

Prison Sentences as a Percentage of All Dispositions

Percent prison sentences ranges from 51.4% for circuit 43 (Caldwell, Clinton, Daviess, DeKalb and Livingston) down to 13.6% for circuit 41 (Macon and Shelby). The average percent is 23.6%. St. Louis City (27.1%) ranks 12th, and St. Louis County (18.6%) and Jackson County (20.6%) are in the lowest one third.

Shock Probation (Chapter 559) and Long-Term Treatment (Chapter 217) Programs as a Percentage of All Prison, Shock and Treatment Sentences

Percent of shock and treatment programs ranges from 51.7% for circuit 35 (Dunklin and Stoddard) down to 12.8% for circuit 22 (St. Louis City). The average percentage is 29.9%. Jackson County (36.5%) ranks 10th, and St. Louis City and St. Louis County (23.2%) are in the lowest quarter.

Average Prison Sentences

St. Louis City has the highest average prison sentence (9.5 years) and Circuit 43 (Caldwell, Clinton, Daviess, DeKalb and Livingston) has the lowest average sentence (4.2 years). Life sentences are included in the average sentence as 30 years. The statewide average sentence is 6.3 years.

Nonviolent Offenders as Percent of Incarcerated Population

The range of incarcerated nonviolent prisoners is from 73.2% of the prison population for circuit 15 (Lafayette, Saline) to 18.0% for Jackson County. The counties with the lowest percentage of nonviolent offenders are the three metro counties (St Louis City, St Louis County and Jackson County). The statewide average is 47.7%.

Recidivism after Two Years for Offenders Released to Parole or on Completion of Sentence The range of recidivism rates is from 47% in circuit 37 (Carter, Howell, Oregon, Shannon) to 28% in circuit 41 (Macon and Shelby). The range in recidivism is relatively narrow with a statewide average of 35.4%.

Recidivism after Two Years of Probation

Probation recidivism (revocations) has a much wider range from 38.8% in circuit 5 (Andrew, Buchanan) to 11.7% in Jackson County. The statewide average is 20.9%. Nearly all the circuits with large populations have low probation recidivism rates.

Although these rankings indicate that sentencing standards appear very different among courts, small numbers in some circuits may add to variability. There may also be differences in the level of crime, the type of crime and in the prior criminal history of the offender population. For example, St. Louis City has a higher percentage of violent crime than other circuits which would

explain the high average prison sentence in St. Louis City. The high volume of crime in St. Louis may explain the low proportion of sentences that result in a prison sentence.

Prison Sentences as a Percentage of All Dispositions

By CIRCUIT

This chart shows the number of defendants by court circuit in fiscal 2015 who, at their first, final disposition are sentenced and committed to prison without the benefit of Chapters 559 and 217 programs. Further, it does not include defendants who have had the imposition of their sentence suspended and are placed on probation. Ranking is in descending order with highest percentage first.

Shock and Treatment Sentences

BY CIRCUIT

This chart shows the number of defendants by court circuit in fiscal 2015 who, at their first, final disposition were sentenced to Chapters 559 and 217 programs expressed as a percentage of all prison and Chapters 559 and 217 programs. This ranking indicates the use of Chapters 559 and 217 programs as an alternative to prison, with the higher ranked counties utilizing alternative programs to a greater degree. Ranking is in descending order with highest percentage first.

Average Prison Sentences

BY CIRCUIT

This chart shows the average sentence length by court circuit in fiscal 2015 of defendants, who, at their first, final disposition, were sentenced to a commitment, without the benefit of 559 and 217 programs. Life sentences are computed as 30 years. Ranking is in descending order with longest average prison sentence first.

			# Prison

This chart shows the average sentence length by sentencing county in fiscal 2015 of defendants, who, at their first, final disposition, were sentenced to a commitment, without the benefit of 559 and 217 programs. Life sentences are computed as 30 years. Ranking is in descending order with a ranking of 1 being the county with the longest average prison sentence.

Paneling Country Circuit Sentence Circuit Sentence Circuit C			Prison	Avg. Sent.			Prison	Avg. Sent.
105 Andrew		Circuit	Sentences	(yrs.)	Ranking County	Circuit	Sentences	(yrs.)

Recidivism Two Years after Release to Parole or on Completion of Sentence

BY CIRCUIT COURT

This chart shows the number and percent of offenders by court circuit who have been returned to prison for a new offense or a violation of supervision within two years of release. This includes offenders first released between July 1, 2008 and June 30, 2013. Recidivism was calculated using offender status on June 30, 2015. Ranking is in descending order, beginning with the highest percentage of offender returns within two years.

Nonviolent Incarcerated Offenders

The following three charts show the numbers of offenders serving nonviolent offenses as a percentage of the incarcerated population on June 30, 2015. Overall, nearly 50% of the incarcerated population are serving nonviolent offenses, and there is considerable variation by circuit and sentencing county in the nonviolent percent of the incarcerated population.

Nonviolent offenses include property, drugs, DWI and less serious public order and weapon offenses. Excluded are homicide, robbery, assault, kidnapping, sex and child abuse offenses, class A and B weapon offenses and nonviolent offenses that require incarceration, such as DWI chronic and habitual offenders.

There is a continuing national debate on the appropriate numbers of nonviolent offenders who should be incarcerated. Nonviolent offenders may have committed crimes that have not endangered personal safety but nonviolent offenders generally have more criminal history and higher rates of recidivism.

The three measures developed for this report are:

- 1. Nonviolent offenders as a percent of the incarcerated population (47.7%)
- 2. Nonviolent offenders with no prior incarcerations as a percent of all incarcerated offenders with no prior incarcerations (27.3%).
- 3. Nonviolent offenders with no prior felony offenses as a percent of all incarcerated offenders with no prior felonies (21.6%).

Prior criminal history is calculated from the DOC offender database but does include criminal histories from other databases when entered by DOC records staff.

On June 30th 2015, the DOC had incarcerated 32,202 offenders of which 15,375 were serving a nonviolent offense (47.7%). Of those nonviolent offenders 1,950 had no prior incarcerations (6.1%) and 960 were serving their first felony sentence (3.0%).

1. Nonviolent offenders

The range by circuit is very wide from 73.2% for Circuit 15 (Lafayette and Saline) to 18% for Jackson County. The metropolitan counties have much lower percentages of nonviolent offenders.

2. No prior incarcerations

The range is also very wide from 52.2% for Circuit 15 (Lafayette and Saline) to 9.1% for Jackson County

3. No prior felonies

.The range is from 52.3% for circuit 36 (Butler and Ripley) to 5.0% for circuit 19 (Cole).

3. INCARCERATION AND FELONY SENTENCING RATES

Incarceration and sentencing rates are similar measures that compare counties by excluding the effect of population size. The incarceration rate is used to measure the seriousness of crime because it is counting the number of offenders in prison, while the sentencing rate measures the total amount of crime, including offenders who receive a probation or prison sentence

Incarceration rate is the number of incarcerations per 100,000 general population. This map of Missouri counties is shaded by range of incarceration rates as of June 30, 2015. The legend includes number and percent of counties falling within each range. The table following includes prison population, county population estimates, incarceration rate and county rank.

Missouri County Incarceration Rate

Incarcerated population, incarceration rate and general population by Missouri county as of June 30, 2015. Ranking is based on incarceration rate.

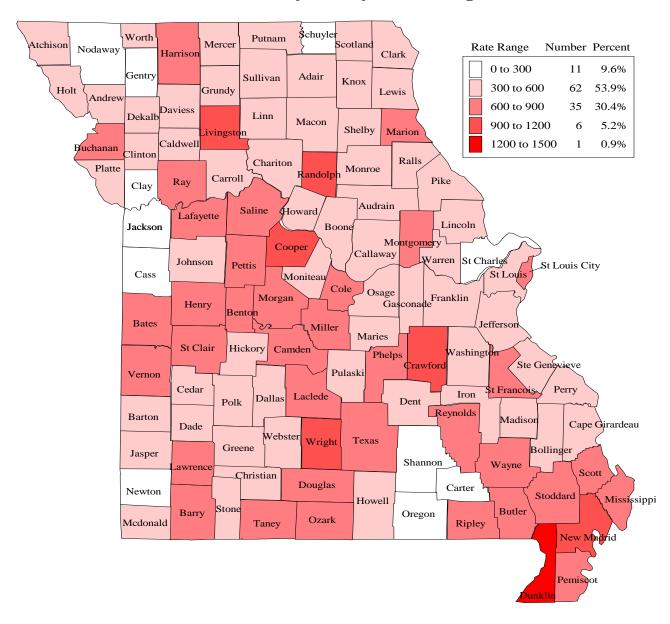

County	Rank	Prison Population	Population Estimate	Incarceration Rate	County	Rank	Prison Population	Population Estimate	Incarceration Rate

4. GEOGRAPHIC DISPARITY IN SENTENCING

When sentencing is grouped into three geographical areas based on population size (Metropolitan, Other First Class Counties and Rural), comparisons indicate that the greatest differences are between the metropolitan areas and the rest of the state. The metropolitan areas have the longest prison sentences but the lowest percentage of prison sentences. Rural counties have higher percentages of probation, shock and treatment sentences than First Class counties. Within the metro areas, Jackson County has the highest percentage of shock and treatment sentences and St. Louis City has both the highest average sentence and percent of prison sentences.

New Sentencing and DOC Commitment, All Offenses, Fiscal 2015

		Pero	Percent Disposition				
			Shock/		Sentence		
Circuits	Sentences	Probation	Treatment	Prison	(yrs)		
Jackson Cnty	1,783	67.8	11.5	20.8	7.6		
St Louis Cnty	3,298	75.5	5.8	18.7	6.2		
St. Louis City	1,781	68.6	4.0	27.3	9.5		
Metro	6,862	71.7	6.8	21.5	7.6		
First Class	8,805	63.4	11.0	25.7	6.1		
Rural	10,517	64.3	11.6	24.1	5.8		
Total	26,184	65.9	10.1	23.9	6.3		

Metro: 16, 21, 2

First Class: 5, 6, 7, 11, 13, 17, 19, 20, 23, 26, 29, 31, 32

Rural: 1, 2, 3, 4, 8, 9, 10, 12, 14, 15, 18, 24, 25, 27, 28, 30, 33, 34, 35, 36, 37, 38,

39, 40, 41, 42, 43, 44, 45

The next three analyses by geographical area breakout the sentencing by offense group and felony class. The intent is to show that much of the apparent difference in sentencing is because of the type of crime and severity of the crime.

Offense Group

Comparing the three geographical areas for similar offenses (offense group) reduces the disparity in prison sentences and sentence disposition, particularly for violent and sex offenses. However, the First Class counties and rural counties still sentenced more offenders to prison for drugs, DWI and nonviolent offenses than the metro areas, although the average prison sentences were similar. St. Louis City has the highest prison disposition for violent and sex offenses and is nearly equal to St. Louis County for drug offenses. Highest average sentences within the metro group also tend to occur in St. Louis City for all but DWI offenses.

Offense Group and Felony Class for violent and sex offenses

The most detailed breakout reduces the differences the most. For violent class A offenses, the first class and rural counties had higher average sentences but similar dispositions to the metro areas. For class C and B violent felonies, the three geographical areas are similar in average sentence but St. Louis City and County made much less use of shock and treatment programs. St. Louis County had a lower average sentence for class A and unclassified sex offenses. The rural and first class counties were similar to Jackson County for class B sex offenses, but all regions were similar for class C sex offenses.

5. SENTENCING DISPARITY BY RACE

The most significant indicator of sentencing disparity by race is the incarceration rate in relation to black, Hispanic and white populations. This rate is the number of incarcerated offenders of each race per 100,000 individuals in the general population. The Missouri incarceration rate for black offenders is 4 times that of white offenders, though the national black incarceration rate is 5.3 times that of white offenders. The incarceration rate for Hispanics in Missouri is lowest and only 45% of the national Hispanic rate. The intent of the following analysis is to explain the reasons for the disparity with available sentencing data.

Incarceration Rates, Fiscal 2015

	Missouri	US [†]
Black ⁺	1,637	1,359
Hispanic	260	582
White ⁺	405	256
Total	527	470

⁺Excludes persons of Hispanic or Latino origin

There are many factors, including socio-economic, that play an important part in explaining the differences in incarceration rates between racial and ethnic groups. The analysis the Commission has conducted attempts to identify the relative impacts of severity of offense, prior criminal history and time served in Missouri.

Using the sentencing data for fiscal 2015, the comparison between the four racial or ethnic groups indicates that black offenders have the highest average prison sentence, 7.7 years, compared to an average of 5.8 years for white offenders. Black offenders also have a higher percent of prison sentences than white offenders (26.8% compared to 22.9%). Hispanics are similar to black offenders in percent of prison sentences (26.8%), but closer to white offenders in average sentence.

[†]US data based on Bureau of Justice Statistics

[&]quot;Prisoners in 2014"; includes federal prisons

Severity of Offense

The disparity in sentencing between races could be explained by differences in the types of offenses committed by the different races. The analysis is by offense group and by offense and felony class for violent, sex and drug offenses. The offense group is an aggregation of offenses into five groups that have similar sentencing practices: Violent, Sex (and child abuse), Drugs, DWI and Nonviolent. The charge code definitions of the offense groups are included the MOSAC User Guide (Appendix D).

For nonviolent offenses, white offenders have a higher percent incarceration than black offenders, but only slightly less than Hispanics. Average sentences are nearly identical for black and white offenders.

Total	1,872	68.9	17.8	13.3	100.0	5.1

^{*}Other includes Native Americans, Asians and Pacific Islanders

For drug offenses in general, percent of prison sentences is identical for black and white offenders, though white offenders have nearly one year less average sentence. By felony class, black offenders show a greater percent of prison sentences but one year less average sentence than white offenders for class A offenses. For class B offenses, black offenders have a higher percent prison sentence and slightly greater average sentence. For C and D class drug offenses, white offenders have greater percent prison sentences and similar or slightly greater average sentences.

^{*}Other includes Native Americans, Asians and Pacific Islanders

For sex and child abuse offenses, the clearest difference is that white offenders comprise the majority of this group. For A and B class offenses, percent of prison sentences is similar for black and white offenders. Average prison sentence is higher for black offenders with class A/unclassified offenses, but higher for white offenders with class B offenses. Overall, percent prison sentences are not vastly different among races. This is probably due to the greater likelihood of these offenses carrying minimum prison terms by statute, dangerous felony requirements or probation restrictions that would equalize sentencing to some degree.

Prior Criminal History

Prior criminal history could explain differences in sentencing between the races because prior offenses result in more severe sentencing. For all sentencing in fiscal 2015, black and white offenders occur in similar percentages at all levels. This is just over one-third in level I (no prior felony convictions), one-quarter in level II (one or two prior felonies), 17% in level III and 10% in levels IV and V. However, for the same level of prior criminal history, black offenders have longer average sentences. For level I, the percent of black offenders with prison sentences is almost twice that of white offenders (12.3% to 6.9%), but this disparity is greatly reduced as prior convictions take effect for levels II – V.

MISSOURI DEPT. 37 CORRECTIONS

Prior Criminal History and Gender

The disparity among races in fiscal 2015 shows some differences between genders. For offenders with priors, white females comprise a greater proportion of levels II – IV than black females, while at level V (three or more incarcerations) black females (4.7%) surpass white females (4.0%). Overall, there is a greater percentage of white females with prior offenses than black females, as evidenced by the lower percentage of white females in level I with no priors (50.5% vs. 57.3%). Black and white males, however, occur at nearly identical percentages except at level V where white males (11.2%) surpass black males (10.4%).

For both males and females, there is a greater percentage of black offenders receiving a prison sentence for level I (no prior felonies). At levels II – IV, both males and females occur in similar proportions between black and white offenders. A disparity arises in level V offenders as percent of black and white males with a prison sentence is nearly identical. In contrast, black females occur at 50%, similar to males, but white females at only 39.3%.

Prior Criminal History and Offense

The more severe sentencing for black offenders indicated in the Prior Criminal History analysis might be because of differences between the races within offense and felony class. The analysis below shows the percent of level I offenders sentenced to prison and the average prison sentence of those offenders, for class A violent, sex and drug offenses, class C nonviolent offenses and all DWI offenses. Because of the smaller sample, the time period was extended to three years (fiscal 2013-2015). In all cases, white offenders had a greater percent of prison sentences and generally similar or longer average sentences than black offenders. Some of these differences may be the result of differences in the offenses and minimum prison terms within the class A violent offense group (Murder, Robbery, Assault).

Time Served

The previous analysis examined variations in sentencing by race, but the disparity that often results in black offenders having a higher incarceration rate than other races could also be the result of the release practices of the Missouri Board of Probation and Parole. For offenders sentenced to a prison sentence, the Board of Probation and Parole has the discretionary responsibility to determine the release date, subject to statutory restrictions on minimum prison time and the statute that defines conditional release.

In fiscal 2015, the Board of Probation and Parole released 7,254 offenders to the first release in their commitment. The average time served was 34 months which was 47.3% of the aggregate sentence. Black offenders served significantly more time than white offenders (45.7 months compared to 29.6 months) and also served more time as a percent of the sentence (55% compared to 43.9%).

					~	~	
		Average	Time	Actual	Guideline	Guideline	Difference between
		Sentence	Served	Percent	/ MPT	/ MPT	Actual & Guideline
Race and Hispanic	Hearings	(mths)	(mths)	Served	(mths)	% Served	Percent Served
Black	1,910	83.1	45.7	55.0%	40.8	49.1%	5.9%
Hispanic	139	71.6	34.5	48.2%	28.8	40.2%	8.0%
White	5,164	67.4	29.6	43.9%	24.4	36.2%	7.7%
Other	41	68.8	35.1	51.0%	28.4	41.3%	9.7%
Total	7,254	71.6	33.9	47.3%	28.8	40.2%	7.1%

The Board bases its release decisions on a risk assessment, known as the salient factor, which is completed prior to the parole hearing. The risk factors include prior criminal history, institutional adjustment, substance abuse, education, age and vocational skills. The instrument has been validated by the DOC to be predictive of the risk of recidivism. The risk assessment, together with the felony class and the offense type, are used to calculate a guideline release date.

A measure of racial disparity is the extent to which the Board's adherence to the guideline sentence varies by race. In fiscal 2015, average time served as a percent of the sentence for black offenders was 55%, while the guideline time served percent of sentence was 49.1%. The Board, therefore, required black offenders to serve 5.9% longer than the guideline time served. However, this was less than the 7.7% additional time served over the guideline stay for white offenders and the average 7.1% over-guideline stay for all offenders. Based upon this analysis there is no racial bias in the Board's compliance with its guidelines.

The greater time served by black offenders is because of the longer, more violent sentences, as explained in the previous section on sentencing, and by the higher risk assessment of black offenders. Only 16% of black offenders are scored Excellent compared to 24% of white offenders, and the average risk score of white offenders is 1.5 compared to 0.6 for black offenders.

Statistical Modeling of the Causes of Sentencing Disparity

The analysis of disparity so far in this section has been descriptive, comparing average sentences for variations in offense severity, felony class and prior criminal history. A broader analysis is possible by developing a statistical model.

Several statistical analyses were undertaken to understand the relationship between race and sentencing decisions in Missouri. However, the relationship between race and sentencing is not straightforward, as there are many other factors that affect sentencing decisions and also vary across race. For example, prior criminal history (page 37) and current offense information both affect sentencing and may differ across racial groups. For the purposes of this analysis, offenses will be described according to the offense group (Violent/Sex/Child Abuse, Nonviolent/DWI, or Drugs) and the felony class. An analysis is presented below based upon sentencing information from fiscal 2009 through 2015.

In Missouri, black offenders are more likely than their white counterparts to have a prior criminal history. They are underrepresented in the first time offender category (1) and overrepresented in all other groups. This difference is statistically significant (p-value < 0.001) and may be causing these offenders to receive more severe sentences on average.

Prior Criminal History Level

				Race	
			White /		
			Hispanic	Black	Total
Prior	1	Count	56893	20429	77322
Criminal		% within race	41.0%	38.1%	40.2%
History	2	Count	33823	13297	47120
		% within race	24.4%	24.8%	24.5%
	3	Count	22729	9416	32145
		% within race	16.4%	17.6%	16.7%
	4	Count	13449	5483	18932
		% within race	9.7%	10.2%	9.8%
	5	Count	11809	4947	16756
		% within race	8.5%	9.2%	8.7%
Total		Count	136734	138703	53572
1		% within race	100.0%	100.0%	100.0%

Additionally, black offenders are far more likely than their white counterparts to be sentenced for A and B felonies (p-value < 0.001). They were sentenced for A felonies at more than twice the rate of white offenders. Statutes require harsher sentences for these types of offenses, and this factor also influences the sentencing differences between racial groups.

Felony	Felony class					
				Race		
			White / Hispanic	Black	Total	
class	A	Count	3367	3740	7107	
		% within race	2.4%	7.0%	3.7%	
	В	Count	17092	8884	25976	
		% within race	12.3%	16.6%	13.5%	
	C	Count	89916	30365	120281	
		% within race	64.8%	56.7%	62.6%	
	D	Count	28328	10583	38911	
		% within race	20.4%	19.8%	20.2%	
Total		Count	136734	138703	53572	
		% within race	100.0%	100.0%	100.0%	

Finally, black offenders are more likely than their white counterparts to be sentenced for violent or sex crimes (p-value <0.001). As with previous factors, the type of offense influences sentencing, and these differences may affect the severity of sentences handed down to individual offenders.

Offense Group)
---------------	---

			R	ace	
			White / Hispanic	Black / Othe	Total

		% within race	100.0%	100.0%	100.0%

In order to understand the interrelationship between the different factors, a logistic regression was used to estimate the probability of an offender receiving a prison sentence. For these purposes, shock incarceration/120 day programs are not included in the prison population. This model includes additional variables one at a time into the model and assesses the changes in the quality of the model fit for each subsequent variable. One important measure of the value of a variable in a model is the R Squared value. This measures the amount that the model is improved by including the additional variable. When the R Squared increases substantially, a variable is important in predicting the outcome. While the variable "race" is included in this model, it is the last variable added (least significant) and does not change the R Squared value in a meaningful way.

Model Summary

Step	-2 Log likelihood		Nagelkerke R Square
Prior Criminal History	190580.670 ^a	.135	.199
Felony Class	178926.481 ^a	.186	.273
Offense Group	172578.474 ^a	.212	.312
Age	171405.291 ^a	.217	.320
Rural/Urban/Metro	170634.474 ^a	.220	.324
Gender	169931.613 ^a	.223	.328
Race	169902.701 ^a	.223	.328

a. Estimation terminated at iteration number 5 because parameter estimates changed by less than .001.

To understand the effect of race, the probability of receiving a prison sentence was determined for an "average" offender. In this case, an "average" offender has some documented criminal history and committed a B or C felony. The table below indicates that if the offender is a white male, the probability of going to prison is 0.50 (50%) while an identical black male has a probability of 0.51 (51%) of going to prison. The opposite effect is seen for females, with black females being slightly less likely than whites to go to prison. Notice that the difference in prison probabilities for the two genders is much larger than that for the two races. This pattern is similar for prior offenses, offense type and rural/urban areas.

Estimated Probability of a Prison Sentence for an Average Defendant

	_	ĺ		95% Wald Confidence Interva	
sex	race	Mean	Std. Error	Lower	Upper
Male	White	.50	.003	.50	.51
	Black	.51	.005	.50	.52
Female	White	.40	.005	.39	.41
	Black	.35	.010	.33	.37

Covariates appearing in the model are fixed at the following values: age=33.07

There is an effect found for the variable rural, which is a measure of how rural or urban an area is. As this variable is also significant (and of much greater magnitude than race), the sentencing circuit court was included in the model instead of the more general variable. This was done to understand how sentencing varies across courts. The results are interesting in that when the sentencing court is included in the analysis, race is no longer included in the model. Also, the circuit court is more important than either age or gender when determining if prison sentences are given. It appears that differences in sentencing between circuit courts may be responsible for the appearance of a small racial effect found in the earlier analysis.

Model Summary Including Circuit Court

		Cox & Snell R	Nagelkerke R
Step	-2 Log likelihood	Square	Square
Prior Criminal History	190580.670 ^a	.135	.199
Felony Class	178926.481 ^a	.186	.273
Offense Group	172578.474 ^a	.212	.312
Circuit Court	167757.977 ^a	.232	.341
Age	166606.762 ^a	.236	.348
Gender	165894.099 ^a	.239	.352

a. Estimation terminated at iteration number 5 because parameter estimates changed by less than .001.

Based upon these analyses, it appears that while black offenders do tend, on average, to serve harsher sentences than white offenders, these effects appear to be due to factors other than race. This general pattern is also seen when 120 Day/Shock Incarcerations are included as a third possible sentencing option. The effect of previous criminal history, offense group and felony class, and gender are well studied in criminal justice literature. However, the great discrepancies across circuit courts are not currently well understood; it appears that the court which sentences an offender has a large effect on the likelihood that the offender has to serve time in prison.

43		Adair, Knox, Lewis	31.0%	
44		Jackson	30.0%	
45		Barton, Cedar, Dade, Vernon	28.8%	

The above chart is a re-working of the first disparity chart on prison sentences as a percent of all sentences (page 11). The chart shows the estimated probability that an average defendant will be sentenced to prison while correcting for variations in offense group, felony class, prior criminal history, gender and age. The adjusted chart still shows considerable variation between circuits,

from a low 29% to a high of 74% which indicates that there is much variation by circuit court that cannot be explained by the analysis. In general, the ranking of circuits does not change after adjustment but the two counties with the most serious crime (St. Louis City and Jackson County) both decrease after adjustment because serious crime has been averaged out of the equation.

Conclusions on Racial Disparity in Sentencing

The analysis of sentencing practice does not find that race is significant at explaining the differences in sentencing between the races. The analysis shows that most of the variation in sentencing between the races is explained by variables that are intended to determine sentencing (offense, felony class and prior criminal history). Two other variables that are known to be related to recidivism are also significant (age and gender). The variations in sentencing between circuit courts may include some racial bias but the impact in the model is small and cannot explain the large differences in incarceration rates between the races. A broader study including socio-economic variables and patterns of policing, arrest and charging will be necessary.

Statistical Modeling of Sentence Length Disparity

The previous section indicates that race is not a determining factor in whether or not an individual receives a prison sentence. In this section the length of prison sentences given is examined. Only individuals who received a prison sentence are considered in this analysis.

A simple t-test comparing the sentence length for whites and blacks (ignoring all other variables) finds that blacks have longer average sentences than whites with a sentence length of 6.15 years for blacks and 6.00 years for whites. This difference is statistically significant with a p-value less than 0.001. However, as has been seen in the last section, there are other differences between the two groups, including the offense group, felony class, and the prior criminal history of the two races. A more in depth investigation is needed to examine these differences.

A standard analysis of variance model (ANOVA) assumes that the errors (differences from the mean) are normally distributed with mean zero and equal variance. This assumption does not appear to be satisfied in this case. Taking the natural logarithm of the sentence lengths makes the errors appear less skewed, but does not make them appear to satisfy these assumptions. However, ANOVA models are robust to some departure from the assumptions and thus are used with caution in this case.

Fitting the model with interactions between pairs of the variables provides a better fit than just examining the effects of each variable individually. However, adding interactions between sets of three variables does not contribute much to the R squared adjusted values; thus the model containing main effects and all two-way interactions is used. This model has an R squared adjusted of 0.60, and provides reasonable fit to the responses observed.

Two variables associated with race have significant p-values in the model. These are the interaction between race and circuit court and the interaction between race and offense group. These interactions indicate that the pattern of average sentence lengths across circuit courts or offense types is different than the pattern of average sentence lengths for whites. The lack of a

significant main effect for race shows no evidence that blacks and whites are treated differently on average; in some cases blacks receive longer sentences and in other cases whites do.

In fact, the average sentence for blacks is slightly shorter than the average sentence for whites when correcting for the effect of gender, offense type and class, prior criminal history, and circuit court; this difference is not statistically significant, and there is no evidence that there is a difference between the races.

Average Prison Sentence (Years) Corrected for Other Variables

			95% Confidence Interval	
race	Mean	Std. Error	Lower Bound	Upper Bound
White	5.291 ^a	1.009	5.202	5.376
Black	5.259 ^a	1.016	5.104	5.425

a. Covariates appearing in the model are evaluated at the following values: age = 33.66.

The most important variables in this model of the length of prison sentences are the class and type of the offense committed. There is a highly significant interaction between these two, which means that the pattern of average sentence lengths across offense classes is different for the three different groups of offenses. This could be due to the fact that some crimes are considered more severe than others, even if they are in the same felony class.

Conclusions on Sentence Length Disparity

This analysis of the length of prison sentences does not indicate that there is any systemic difference between the races. However, the two significant interactions between race and the offense type and race and the circuit courts could potentially indicate that race does play some role in determining the lengths of sentences. It could also be simply a byproduct of the types of crimes that individuals in the different circuits or offense groups for which the two racial groups are being sentenced. Due to the small number of prison sentences arising from some of these combinations of race and circuit court or offense group, these differences could also simply be the effect of small sample size. Continuing study in this area over time may help illuminate the causes of the differences that are observed here.

Statistical Modeling of Parole Decisions

The parole board determines parole dates for offenders in prison and utilizes several measures to inform their decision making. On the basis of the type of offense committed, a risk assessment tool, and the length of an individual's sentence, guidelines for parole release have been established. In this section, the relationship between the guideline parole date (or minimum prison time required by statute, if this is longer) and the actual parole date is examined.

A simple examination of the relationship between race and whether or not an offender is released by the guideline date reveals a surprising trend. When ignoring other factors which potentially influence adherence to guidelines, it appears that race is an important factor in determining whether or not an offender is released and that black offenders are more likely to be released by guidelines when compared to white offenders.

Race and Percent Over Guideline Level

			Over Guidelines		
			No	Yes	Total
Race	Black	Count	3290	2744	6034
		% within Race	54.5%	45.5%	100.0%
	White	Count	7778	8384	16162
		% within Race	48.1%	51.9%	100.0%
Total		Count	11068	11128	22196
		% within Race	49.9%	50.1%	100.0%

However, as was observed in the previous sections, there are additional variables that differ between black and white offenders. In this case, studying those factors further demonstrates that the difference observed between the races is actually due to differences in the types and severity of offenses between the two races, and not due to different treatment of the two races by the parole board.

For example, whites are overrepresented in both the DWI and sexual/child abuse offense categories. These two categories are far more likely that the other categories to be over guidelines. This could be one of the reasons why white appear more likely than blacks to be over guidelines.

	Violent	Count	1926	2324	4250
		% within Offense	45.3%	54.7%	100.0%
Total		Count	6034	16162	22196
		% within Offense	27.2%	72.8%	100.0%

To determine which factors are important in determining if an offender is released after guidelines, a logistic regression was used to determine the probability of being over guidelines. Terms are entered into the model and the effect on the pseudo-R Squared values are determined. Important variables increase this value; the offense type and offense class are the two most significant predictors found in this model. The race of the individual does not enter into the model

at all, as it does not explain enough of the variability that remains after the offense information is included.

Model Summary

		Cox & Snell R	
Step	-2 Log likelihood	Square	Nagelkerke R Square
Offense Group	29047.708a	.075	.100
Felony Class	28627.377a	.092	.123
Risk Category	28311.438a	.105	.140
Age	28283.309a	.106	.141
Gender	28267.050a	.107	.142
Sentence Length	28258.752a	.107	.143

a. Estimation terminated at iteration number 5 because parameter estimates changed by less than .001.

The p-values for including the variables into the model shows the same pattern as indicated above. The five variables that enter the model all have p-values less than 0.01, while the p-value for race is 0.95, indicating that race is not a predictor of whether or not an individual is paroled after their guideline date.

One interesting feature that emerges from an examination of these data deals with the trend found for offense type. After correcting for the effects of all other variables in the model, the sexual and child abuse offenses and DWI offenses are both much more likely to be over their corresponding guidelines than other offense types. For sexual offenses, statute requires that an individual complete the Missouri Sexual Offender Program (MOSOP) in order to be eligible for parole; parole board policy generally allows offenders to complete this requirement around the time of their conditional release date. Thus, it makes sense that these individual may not be released by their guideline dates.

Estimated Probability of being Over Guidelines by Offense Group

			95% Wald Confidence Interval		
Offense Group	Mean	Std. Error	Lower	Upper	
Drug	.43	.010	.42	.45	
DWI	.84	.012	.82	.86	
Nonviolent	.39	.008	.37	.41	
Sex/Child Abuse	.87	.010	.85	.89	
Violent	.47	.010	.45	.49	

Covariates appearing in the model are fixed at the following values: Age=34.11 years; Sentence=71.49 months

Also of note is the fact that after correcting for the effects of the other variables in the model, offenders with better risk assessments are more likely to be over guidelines than those with worse assessments. This may be due to the fact that offenders with very good risk assessments have very short guidelines, making it easier for them to remain in prison past the guideline, while offenders with poor risk assessments will have very long guidelines, making them easier to meet.

Estimated Probability of being Over Guidelines by Risk Score

			95% Wald Confidence Interval		
Salient Factor	Mean	Std. Error	Lower	Upper	
Excellent	.75	.010	.73	.77	
Above Average	.70	.009	.68	.72	
Average	.66	.009	.64	.68	
Below Average	.56	.013	.53	.59	
Poor	.48	.019	.44	.52	

Covariates appearing in the model are fixed at the following values: Age=34.11 years; Sentence=71.49 months

As the requirement for MOSOP can have such a large effect on the results for offenders in this group, the analysis can be considered excluding this group of offenders. The results of this reduced analysis show the same pattern as the complete analysis, which the race of an individual continuing to be not significant (p-value 0.59), and the order of importance of the variables remaining unchanged. Thus, in the interest of brevity, only the results for the analysis including all offense groups is included in this report.

Conclusions on Racial Disparity in Parole Decisions

The Parole Board makes parole decisions based upon a number of factors including offense history, and risk assessment. Based upon these analyses, the race of an offender does not have any bearing on whether or not that offender is paroled by the appropriate guideline for their risk level and offense type/class. However, there could still be differences observed between the length of time that offenders serve on their sentences based upon the types of crimes that they are serving time for and their risk based upon the risk assessment tools utilized by the department of corrections. Further study for the effects of other potential variables could shed more light on the nature of any differences that are observed.

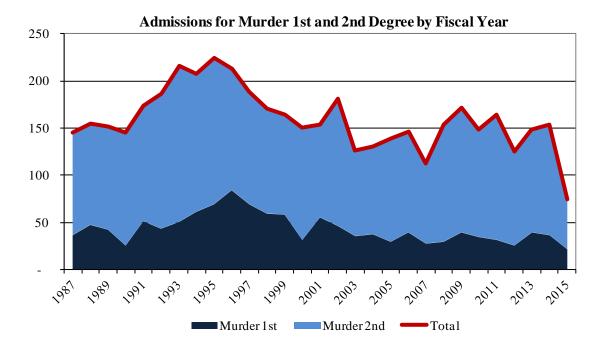

6. DISPARITY IN THE APPLICATION OF THE DEATH PENALTY

The study analyzes recent trends in prison admissions for murder, including sentences that require the death penalty, and provides measures that identify racial and geographic disparity in the application of capital punishment.

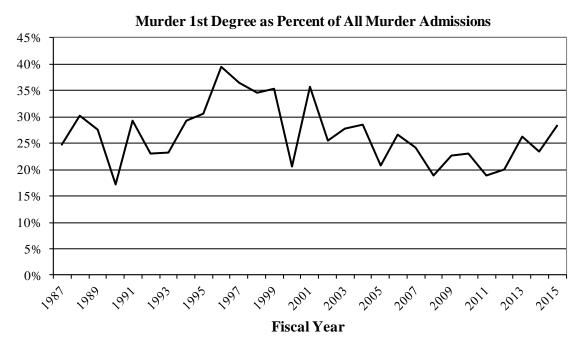

Sentencing and Sentences for Murder (Chapter 565, RSMo.)

The death sentence for murder was re-imposed in Missouri in 1977 as Capital Murder, and the authorized sentences were the death penalty or life with no parole for 50 years. In October 1984, Capital Murder was replaced by Murder 1st degree, and the authorized sentences were the death penalty or life without parole. Prior to October 1984, Murder 1st degree had an authorized sentence of life with parole eligibility. The death penalty analysis for Murder 1st degree includes sentences of Capital Murder but excludes sentences of Murder 1st degree for offenses committed prior to October 1984. The sentencing data used in this review uses the first sentencing decision, though following appeals against the death penalty the original decision may be later reversed.

From fiscal 1995 to 2007, admissions for Murder generally declined, but then increased above pre-1990's levels through fiscal 2014. There was a marked decrease again in fiscal 2015.

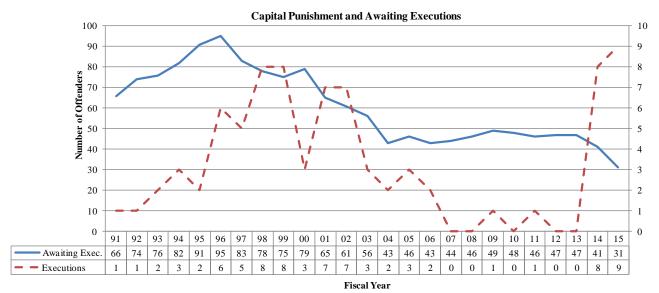

Murder 1st degree admissions as a percent of all murder admissions generally declined from fiscal 1996 through fiscal 2011, but have since shown an increasing trend.

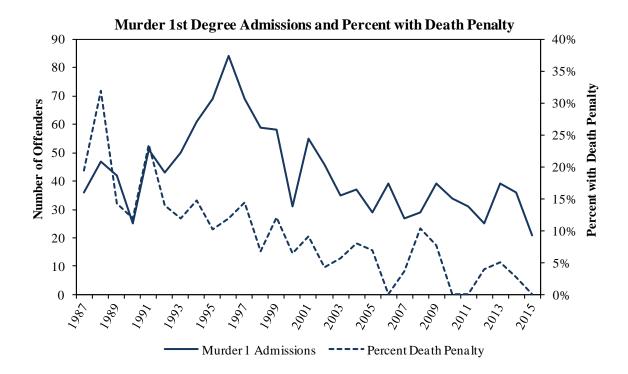

Application of the Death Penalty

In January 2006, a US District Court issued a decision on the constitutionality of Missouri's method of execution that placed a moratorium on executions. The 8th Circuit Court of Appeals vacated that decision in June 2008 but few executions were held until 2014. Nine executions were held in fiscal 2015 and the number currently awaiting execution is 31. The percent of Murder 1st degree admissions that are sentenced to death has declined from a maximum of 32% in fiscal 1988 to less than 5% over the past several years. Only three capital punishment offenders have been admitted in the last three years.

Geographic Disparity in the Application of the Death Penalty

From the earliest data since re-introduction of capital punishment to fiscal 1997, the First Class and Rural county circuits had the highest rates of capital punishment. Since 1997, when the rate at which capital punishment application began to decline, St. Louis County has become the county circuit with the highest rate of capital punishment (17.3%). St. Louis City and Jackson County have the lowest rate of capital punishment (0.9% and 0.5% respectively).

Death Penalty Sentencing By Court Circuit Fiscal 1987 - 1997

				Murder 1	DP
	All	Murder	Death	as Pct. Of	as Pct. Of

Racial Disparity in the Application of the Death Penalty

Commitment rates for murder indicate that black offenders are eleven times more likely to be convicted of murder than other races combined.

The indicators used to measure racial disparity in the application of the death penalty are:

- The percent of offenders convicted of Murder 1st degree that receive the death penalty.
- The percent of offenders who are convicted of Murder who are sentenced to Murder 1stdegree.

The two measures indicate that offenders of other races (all other race/ethnic groups combined) are more likely to be convicted of Murder 1st and to receive the death penalty than black offenders. From fiscal 1988 to 1997, 12.5% of black offenders convicted of Murder 1st degree received the death sentence compared to 20.2% of other races. From fiscal 1998 to 2015, 3.7% of black offenders convicted of Murder 1st degree received the death sentence compared to 9.4% of other races.

Average Annual Murder Sentencing Rates per 100,000 population

	FY87-FY97	FY98-FY15	FY15
Black	16.69	11.90	11.83
Other Races	1.49	1.16	1.00
Total	3.28	2.41	2.28

Sentencing rate is:

Annual sentences for murder/Missouri population *100,000 Missouri Population: US Bureau of Census 1990, 2000, 2013

Murder 1st as Percent of Murder Sentences and Death Penalty sentences as a Percent of Murder 1st Degree Sentences By Race

that det 15t as 1 electric of that del geneences and Dedail 1 charty sentences as a 1 electric of that del 15t Deglee geneences by face										
	Blacks				Other Races					
				Murder 1	DP				Murder 1	DP
	All	Murder	Death	as Pct. Of	as Pct. Of	All	Murder	Death	as Pct. Of	as Pct. Of
	Murder	1st	Penalty	Murder	Murder 1st	Murder	1st	Penalty	Murder	Murder 1st
FY 1987-FY 1997	1,187	305	38	25.7%	12.5%	790	257	52	32.5%	20.2%
FY 1998-FY 2015	1,474	353	13	23.9%	3.7%	1,092	308	29	28.2%	9.4%
FY 2015	84	19	-	22.6%	0.0%	53	19	-	35.8%	0.0%

During the period from fiscal 1998 to 2015, a smaller proportion of black offenders received the death sentence than other races across county circuits. However, the difference may not be statistically significant because of the relatively small numbers of Murder 1st degree cases.

Death Penalty Sentencing By Court Circuit and Race, Fiscal 1998 - 2015

	Blacks					Other Races

7. RECIDIVISM AND SENTENCING DISPOSITION

The Sentencing Commission is aware that a prison sentence is not always the sentence that has the best chance of success in reducing future recidivism. Prison can reinforce criminal behavior and permanently damage family, social and employment connections. Identifying alternative non-prison sentences that enable community rehabilitation to occur is an important responsibility for the Commission. The following Commission study of recidivism examines the relationship between recidivism and the type of sentence and the effect of prior criminal history on rehabilitation.

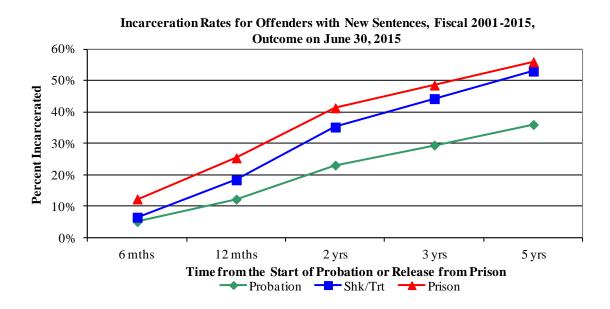

The study uses data from the Department of Corrections of offenders received for a new felony offense between July 2001 and June 2015. Two measures of recidivism are calculated:

- 1) The first incarceration following the start of a new probation or a release from prison. The incarceration may be for a technical violation while on probation or parole or for a new sentence.
- 2) The first new conviction following the start of a new probation or a release from prison. The new conviction may be a prison or probation sentence supervised by the Department of Corrections.

The time period for the study is 15 years. This is necessary as there needs to be a sufficient number of offenders who have been incarcerated and released at least five years in order to calculate five year recidivism rates for all offenders, irrespective of sentencing disposition.

Recidivism Rates for Probation Compared to Prison

The first analysis compares recidivism of offenders sentenced to probation to recidivism by offenders sentenced and released from prison.

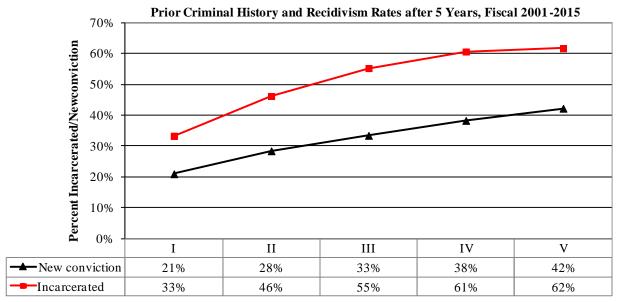

Average Recidivism Rates for Offenders with New Sentences, Fiscal 2001-2015

Actual		Released	Percent in Prison within						
Sentence	Sentences	5 years+	6 mths	5 yrs					
Probation	239,160	151,382	5.1%	12.3%	23.1%	29.4%	36.0%		
Shk/Trt	40,709	24,047	6.5%	18.4%	35.2%	44.2%	53.0%		
Prison	75,019	38,549	12.3%	25.4%	41.3%	48.5%	55.9%		
Total	354,888	213,978	6.7%	15.6%	28.0%	34.9%	41.8%		

The data shows that offenders sentenced to probation have lower recidivism rates than prison based sentences. After five years, probationers are 20% less likely to be later incarcerated than offenders released from prison.

The Impact of Prior Criminal History on Recidivism

The recidivism analysis indicates that both the incarceration rate and the new conviction rate increase with increasing prior criminal history. The incarceration rate for Levels 4 and 5 offenders, however, has almost leveled off at 62%. Incarceration rates are generally higher than new conviction rates because of revocations of probation and parole for technical violations of supervision, including arrests for new offenses but without new charges being filed.

Prior Criminal History Level

The Impact of Prior Criminal History on Probation or Prison Outcomes

If recidivism increases with prior criminal history, but probation sentences generally result in lower recidivism it is useful to calculate at what level of prior criminal history does probation cease to be the low recidivism sentence.

Recidivism Rates After Two Years by Sentence Type and Prior Criminal History Fiscal 2001-2015

		Prior	Criminal History Le	evel	
	I	П	III	IV	V
	No prior felonies, no	1/2 felonies, no	1 incarceration or 3	2 incarcerations or	3+ incarerations or
Sentence	more than 3 misd.	incarceration	felonies	4 felonies	5+ felonies
Probation	19.2%	25.9%	33.8%	38.5%	39.0%
Shk/Trt	28.6%	35.0%	38.5%	42.4%	45.1%
Prison	34.8%	40.8%	44.2%	45.4%	42.9%
Average	21.0%	30.8%	38.6%	42.2%	42.0%
Recidivism Gap					
Prison Rate less					
Probation Rate	15.6%	14.9%	10.4%	6.9%	3.9%

From the analysis of fiscal 2001-2015 new sentencing there is a 15.6% reduction in recidivism after two years for Level 1. For Level 2 offenders sentenced to probation compared to those sentenced to prison there is a reduction in recidivism of 14.9%. For Level 5 offenders, the gap between probation and prison recidivism is less than 4%. It is important to note that these rates were calculated from actual sentencing and not from a statistically matched comparison sample. There may be factors that influenced the sentencing decision to grant probation to an offender with considerable prior criminal history, and it is these factors that predicted the lower recidivism outcomes.

APPENDIX I: RECIDIVISM BY CRIMINAL HISTORY, DISPOSITION AND OFFENSE

The following table presents recidivism rates by charge code, accounting for prior criminal history and sentencing disposition.

1. Prior criminal history is broken out by five levels of increasing severity

Level I No felonies and no more than three misdemeanors

Level II One or two unrelated felonies or more than three misdemeanors

Level III Three unrelated felonies or one incarceration > 30 days

Level IV Four unrelated felonies or two incarcerations > 30 days

Level V Five or more unrelated felonies or three or more incarcerations > 30 days

- 2. Disposition on the initial sentencing is Probation, court stipulated 120 day or long term drug sentence or prison.
- 3. Recidivism is calculated after two years from the start of probation or release from prison and recidivism is incarceration for a conviction for a new offense or a violation of probation or parole.
- 4. Because many offenses (charge codes) can have small numbers of convictions when broken out by prior criminal history and sentencing disposition it is necessary to aggregate some offenses into larger aggregates to calculate consistent recidivism rates over time. The level of aggregation is indicated in the column 'Recidivism Calculation'. If there are at least five records in each prior criminal history level for each sentencing disposition then the recidivism is calculated for the offense (CHRG), otherwise the recidivism is calculated for the offense group and the felony class group (GROUP).

Comment

A 14 year time frame was used to provide adequate numbers of offenders and time to allow for a two year recidivism rate to be calculated for as many offenses as possible. Offenses with less than five offenders are not included but care should be exercised in interpreting the recidivism particularly when the numbers in the study are small. Although the study has used a 14 year time frame, the numbers of offenders sentenced to prison for serious violent and sex offenses and released at least two years may be very small compared to the number sentenced. For non-violent offenses, the study size is sufficient for rates to be calculated for specific offenses.

APPENDIX II: FELONY SENTENCES, PERCENT DISPOSITION AND AVERAGE SENTENCE BY OFFENSE

The following table contains the total number of sentences, percent of sentence by disposition and average sentence by individual offense for a five year range from fiscal 2011-2015. Sentencing data is extracted from the DOC OPII database and includes the first sentence for unrelated sentences in Missouri courts. Related sentences are sentences handed down at the same court and on the same day for the same offender. Where there is more than one related sentence, the most serious sentence is selected. Revocations of sentences are not included. Prison sentences include only sentences for a term sentence (commitment). Sentence average is for prison sentences only and does include sentences for SES probation and 120-day.

Charge		New Charge Code	Felony	Offense	Sentence		Percent		Sentence

APPENDIX III: AUTHORIZING STATUTE: SECTION 558.019, RSMO

- 6. (1) A sentencing advisory commission is hereby created to consist of eleven members. One member shall be appointed by the speaker of the house. One member shall be appointed by the president pro tem of the senate. One member shall be the director of the department of corrections. Six members shall be appointed by and serve at the pleasure of the governor from among the following: the public defender commission; private citizens; a private member of the Missouri Bar; the board of probation and parole; and a prosecutor. Two members shall be appointed by the supreme court, one from a metropolitan area and one from a rural area. All members shall be appointed to a four-year term. All members of the sentencing commission appointed prior to August 28, 1994, shall continue to serve on the sentencing advisory commission at the pleasure of the governor.
- (2) The commission shall study sentencing practices in the circuit courts throughout the state for the purpose of determining whether and to what extent disparities exist among the various circuit courts with respect to the length of sentences imposed and the use of probation for offenders convicted of the same or similar crimes and with similar criminal histories. The commission shall also study and examine whether and to what extent sentencing disparity among economic and social classes exists in relation to the sentence of death and if so, the reasons therefor sentences are comparable to other states, if the length of the sentence is appropriate, and the rate of rehabilitation based on sentence. It shall compile statistics, examine cases, draw conclusions, and perform other duties relevant to the research and investigation of disparities in death penalty sentencing among economic and social classes.
- (3) The commission shall study alternative sentences, prison work programs, work release, home-based incarceration, probation and parole options, and any other programs and report the feasibility of these options in Missouri.
- (4) The governor shall select a chairperson who shall call meetings of the commission as required or permitted pursuant to the purpose of the sentencing commission.
- (5) The members of the commission shall not receive compensation for their duties on the commission, but shall be reimbursed for actual and necessary expenses incurred in the performance of these duties and for which they are not reimbursed by reason of their other paid positions.
- (6) The circuit and associate circuit courts of this state, the office of the state courts administrator, the department of public safety, and the department of corrections shall cooperate with the commission by providing information or access to information needed by the commission. The office of the state courts administrator will provide needed staffing resources.
- 7. Courts shall retain discretion to lower or exceed the sentence recommended by the commission as otherwise allowable by law, and to order restorative justice methods, when applicable.

- 8. If the imposition or execution of a sentence is suspended, the court may order any or all of the following restorative justice methods, or any other method that the court finds just or appropriate:
- (1) Restitution to any victim or a statutorily created fund for costs incurred as a result of the offender's actions;
- (2) Offender treatment programs;
- (3) Mandatory community service;
- (4) Work release programs in local facilities; and
- (5) Community-based residential and nonresidential programs.
- 9. The provisions of this section shall apply only to offenses occurring on or after August 28, 2003.
- 10. Pursuant to subdivision (1) of subsection 8 of this section, the court may order the assessment and payment of a designated amount of restitution to a county law enforcement restitution fund established by the county commission pursuant to section 50.565. Such contribution shall not exceed three hundred dollars for any charged offense. Any restitution moneys deposited into the county law enforcement restitution fund pursuant to this section shall only be expended pursuant to the provisions of section 50.565.
- 11. A judge may order payment to a restitution fund only if such fund had been created by ordinance or resolution of a county of the state of Missouri prior to sentencing. A judge shall not have any direct supervisory authority or administrative control over any fund to which the judge is ordering a defendant to make payment.
- 12. A defendant who fails to make a payment to a county law enforcement restitution fund may not have his or her probation revoked solely for failing to make such payment unless the judge, after evidentiary hearing, makes a finding supported by a preponderance of the evidence that the defendant either willfully refused to make the payment or that the defendant willfully, intentionally, and purposefully failed to make sufficient bona fide efforts to acquire the resources to pay.
- 13. Nothing in this section shall be construed to allow the sentencing advisory commission to issue recommended sentences in specific cases pending in the courts of this state.

(L. 1986 H.B. 1098 § 1, A.L. 1988 H.B. 1340 & 1348, A.L. 1989 S.B. 215 & 58, A.L. 1990 H.B. 974, A.L. 1993 H.B. 562, A.L. 1994 S.B. 763, A.L. 1998 H.B. 1508 merged with S.B. 766, A.L. 2003 S.B. 5, A.L. 2004 H.B. 1055, A.L. 2005 H.B. 353, A.L. 2012 S.B. 628)

(2000) Legislative intent of section was to increase or enhance punishment for present as opposed to prior conviction and thus is not an ex post facto law. Bailey v. Board of Probation and Parole, 36 S.W.3d 13 (Mo.App.W.D.).
